mpv for Android

mpv-android is a video player for Android based on libmpv.

Features

- Hardware and software video decoding
- Gesture-based seeking, volume/brightness control and more
- libass support for styled subtitles
- Secondary (or dual) subtitle support
- High-quality rendering with advanced settings (scalers, debanding, interpolation, ...)
- Play network streams with the "Open URL" function
- Background playback, Picture-in-Picture, keyboard input supported

Library?

mpv-android is **not** a library/module (AAR) you can import into your app.

If you'd like to use libmpv in your app you can use our code as inspiration. The important parts are `MPVLib`, `BaseMPVView` and the native code. Native code is built by these scripts.

Downloads

You can download mpv-android from the Releases section or

Note: Android TV is supported, but only available on F-Droid or by installing the APK manually.

Building from source

Take a look at the README inside the `buildscripts` directory.
